Lab Number:	4
Student Name:	**Shivraj Harish Shetty**
Roll No :	**38**

Title:

4.1 Write a Java program to Create a class Student with two method getData() and printData(). getData() to get the value from the user and display the data in printData(). Create the two objects s1 ,s2 to declare and access the values from class StudentTest.

4.2 Write a Java program for Basic bank Management System

Learning Objective:

- Students will be able to write C++ and java program for using classes and objects.

Learning Outcome:

- Ability to execute a simple C++ and Java program by accepting and displaying values using functions
- Understanding the classes and objects concept in C++ and Java.

Course Outcome:

ECL304.1	Understand object-oriented programming concepts and implement using C++ and Java

Theory:

Q1. Explain about Constructor.

A constructor is a block of codes similar to the method. It is called when an instance of the class is created. At the time of calling constructor, memory for the object is allocated in the memory.It is a special type of method which is used to initialize the object.
Every time an object is created using the new() keyword, at least one constructor is called.It calls a default constructor if there is no constructor available in the class. In such case, Java compiler provides a default constructor by default.
There are two types of constructors in Java: no-arg constructor and parameterized

constructor. Q2. Explain about classes and objects in Java

Faculty: Ms. Deepali Kayande

CLASS: It is a user defined blueprint or prototype from which objects are created. It represents the set of properties or methods that are common to all objects of one type. In general, class declarations can include these in order:

1. Modifiers: A class can be public or has default access class keyword: class keyword is used to create a class.
2. Class name: The name should begin with an initial letter (capitalized by convention).
3. Superclass (if any): The name of the class's parent (superclass), if any, preceded by the keyword extends. A class can only extend (subclass) one parent.
4. Interfaces (if any): A comma-separated list of interfaces implemented by the class, if any, preceded by the keyword implements. A class can implement more than one interface.
5. Body: The class body surrounded by braces, { }.

OBJECTS: It is a basic unit of Object-Oriented Programming and represents the real life entities. A typical Java program creates many objects, which as you know, interact by invoking methods. An object basically consists state, behaviour, identity.

Q3.How to access class attributes and methods? Explain with example.

You can access attributes by creating an object of the class, and by using the dot syntax (.)In the example we will create an object of the Main class, with the name myObj. We use the x attribute on the object to print its value.

EG. Create an object called "myObj" and print the value of x:

```java
public class

 Main { int x = 5;

 public static void main(String[]

  args) { Main myObj = new

  Main();

  System.out.println(myObj.x);

 }
```

Or override existing

values: EG. Change the

value of x=25

```java
public class Main {

 int x = 10;
```

```java
public static void main(String[]

args) { Main myObj = new

Main();

myObj.x = 25; // x is now

25

System.out.println(myObj.

x);
```

If you don't want the ability to override existing values, declare the attribute as final:

```java
public class

Main { final int x

= 10;

public static void main(String[]

args) { Main myObj = new

Main();

myObj.x = 25; // will generate an error: cannot assign a value to a final

variable System.out.println(myObj.x);
```

METHODS: Methods define behaviour of a class. A method contains business logic which is executed when the method is invoked. Methods are the ways to manipulate objects data. Let's take a look at the below example

Syntax of a method :

<access-modifier> <return-type> <name-of-the-method> ({optional}<type-of-parameter> <name-of- the-parameter>){ //method logic //method logic }

example: public void displayPlayerInfo()

1. Write a Java program to Create a class Student with two method getData() and printData(). getData() to get the value from the user and display the data
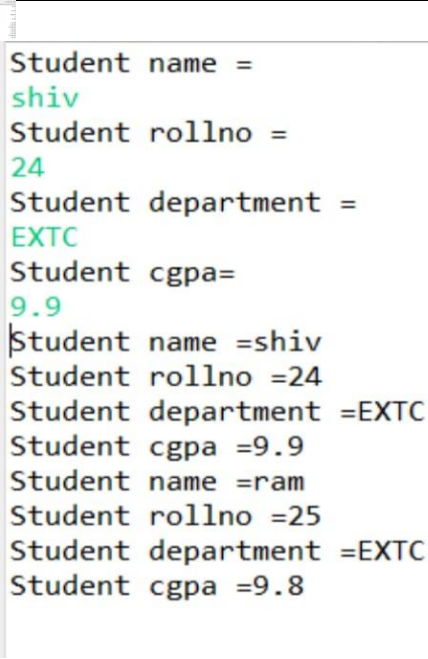

in printData(). Create the two objects s1 ,s2 to declare and access the values from class StudentTest.

Algorithm :	STEP 1. Start
	STEP 2. Define Class Student
	STEP 3. Define attributes – Name , Roll_no, cgpa, div , branch
	STEP 4. Define and declare method – getdata() to get input from user.
	STEP 5. Define and declare method – printdata() to print the values
	STEP 6. Define Main function()
	STEP 7. Create object s1, s2 to call the class functionality.
	STEP 8. Print result
	STEP 9. End.

Program:

```java
import java.util.Scanner;
 class Student
{
    Scanner in=new Scanner(System.in);
    String name;
    int rollno;
    String department;
    float cgpa;

//method overloading
 void getData()
{
    Scanner t = new Scanner(System.in);
System.out.println("Student name =");
name= t.next();
System.out.println("Student rollno =");
rollno= t.nextInt();
System.out.println("Student department =");
department= t.next();
System.out.println("Student cgpa=");
cgpa= t.nextFloat();
}

 void getdata( String n, int r, String d, float c)
 {
        name=n;
        rollno=r;
        department=d;
        cgpa=c;
 }

 void printdata()
```

```java
    {
            System.out.println("Student name =" +name);
            System.out.println("Student rollno =" +rollno);
            System.out.println("Student department ="+department);
            System.out.println("Student cgpa ="+cgpa);
    }
};
public class StudentTest
{
public static void main(String args[])
{
Student s1=new Student();
Student s2=new Student();

s1.getData(); //non parameter
s1.printdata();

s2.getdata("ram", 25, "EXTC", (float)9.8 );
s2.printdata();

}
}
```

Input given:	Student name= shiv Student rollno=24 Student department= EXTC Student cgpa=9.9
| Output Screenshot: | ```
Student name =
shiv
Student rollno =
24
Student department =
EXTC
Student cgpa=
9.9
Student name =shiv
Student rollno =24
Student department =EXTC
Student cgpa =9.9
Student name =ram
Student rollno =25
Student department =EXTC
Student cgpa =9.8
``` |

Faculty: Ms. Deepali Kayande

2. Write a Java program for Basic bank Management System

Algorithm :	STEP 1. Start
	STEP 2. Define Class BankLab 2
	STEP 3. Define attributes – Name , account_type , account_number, amount, balance \
	STEP 4. Declare attributes by using constructor of class.
	STEP 5. Define and declare method – deposit() to deposit the amount
	STEP 6. Define and declare methods – withdraw() to withdraw the amount
	STEP 7. Define and declare methods – display() to display the account details
	STEP 8. Define Main function()
	STEP 9. Create object b1, b2, b3 to call the class functionality.
	STEP 10. Do – while loop to repeat the process.
	STEP 11. Print results
	STEP 12. end
| **Program:** | ```java
import java.util.Scanner;

public class BankLab2 {

        Scanner in=new Scanner(System.in);

        String name;

        char account_type;

        int account_number,amount;

        float balance;

        public BankLab2(String n,int a, char t, float b) {

                // TODO Auto-generated constructor stub

                name = n;
``` |

```java
            account_number=a;

            account_type=t;

            balance=b;

    }

    int deposit()

    {

            System.out.println("Enter the amount to deposit:
");

            int amount=in.nextInt();

            if(amount<0)

            {

                    System.out.println("Invalid amount,Enter a
valid amount");

                    return 0;

            }

            balance=balance+amount;

            return 1;

    }

    int withdraw()

    {

            System.out.println("Your Balance= "      +balance
);

            System.out.println("Enter amount to withdraw:
");

            int amount=in.nextInt();

            if (balance<amount)
```

```java
            {
                    System.out.println("Insufficient Balance:
");

                    return 0;

            }

            if(amount<0)

            {

                    System.out.println("Invalid amount" );

                    return 0;

            }

            balance=balance-amount;

            return 1;

    }

    void display()

    {

            System.out.println("Name :"+name);

            System.out.println("Account Number:"
+account_number);

            System.out.println("Account Type:"
+account_type);

            System.out.println("Balance: " +balance);

    }

    public static void main(String[] args) {
            // TODO Auto-generated method stub

            Scanner in=new Scanner(System.in);

            BankLab2 b1=new BankLab2("salman",1,'s',2000);

            BankLab2 b2=new BankLab2("makarand",2,'s',2000);
```

```java
            BankLab2 b3=new
BankLab2("siddharth",3,'s',2000);

        System.out.println("Menu");

        System.out.println("1.Deposit");

        System.out.println("2.Withdraw");

        System.out.println("3.Display");

        System.out.println("Enter option");

        int op=in.nextInt();

        char ans;

        do

        {

            System.out.println("Please enter your
account number:");

                int account_number=in.nextInt();

                    switch(account_number)

                    {

                        case 1:      if(op==1)

    b1.deposit();

                                     if(op==2)

    b1.withdraw();

                                     if(op==3)

    b1.display();

                                     break;

                        case 2:      if(op==1)

    b2.deposit();
```

```java
                                                    if(op==2)

                b2.withdraw();

                                                    if(op==3)

                b2.display();

                                                    break;
                                    case 3:        if(op==1)

                b3.deposit();

                                                    if(op==2)

                b3.withdraw();

                                                    if(op==3)

                b3.display();

                                                    break;
                                        default:
System.out.println("Enter value between 1 to 3");

                                                    break;

                            }
                            System.out.println("Do you want to
continue?[Y/N]");
